MINI PROJECT

SEMESTER VI

for the degree of

BACHELOR OF ENGINEERING IN

COMPUTER ENGINEERING

by

SHELDON PATEL (2024012006)

SWAROOP SHELKE (202301050)

CONROY YARDE (202301062)

JOY NIGREL (2024012004)

UNDER THE GUIDANCE

OF

Dr. Sushama Khanvilkar
(Head of Department)

Department of Computer Engineering,

Xavier Institute of Engineering, Mahim,

Mumbai - 400 016 University of Mumbai

(AY : 2025 - 2026)

Institute Vision and Mission

Vision of Institute

To nurture the joy of excellence in a world of high technology.

Mission of Institute

To strive to match Global Standards in technical education by interaction with industry, continuous training and development of quality of life.

Department Vision and Mission

Vision of Computer Department

To nurture the joy of excellence in the world of Computer Engineering.

Mission of Computer Department

M1: To provide students the knowledge of computer engineering with related technical skills to solve various computer engineering problems and to have industry interaction.

M2: To motivate the students to acquire additional soft skills to sharpen their technical and professional skills that make them employable.

M3: To nurture social and professional ethics in our undergraduates and encourage them to have lifelong learning.

Program Specific Objectives (PSO)

PSO1	The ability to understand, analyze and apply knowledge to address computing problems.
PSO2	The ability to design and implement software solutions to meet the end users requirements.

Program Educational Objectives (PEOs)

PEO1	Graduates will have the required knowledge of computer engineering, to design and develop systems that can cater to a multi-disciplinary environment.
PEO2	Graduates will be able to apply the art of self-learning to use the modern tools in solving computer engineering problems.
PEO3	Graduates will be prepared in the field of computer engineering to have lifelong-learning in the global and ethic context.
PEO4	Graduates will be able to inculcate professional and ethical attitude with good leadership qualities and have commitment to social responsibilities in their thought process.

Program Outcomes (PO): A graduate of Computer engineering will have the ability:

PO1	Engineering Knowledge: Apply knowledge of mathematics, natural science, computing, engineering fundamentals and an engineering specialization as specified in WK1 to WK4 respectively to develop the solution of complex engineering problems.
PO2	Problem Analysis: Identify, formulate, review research literature and analyze complex engineering problems reaching substantiated conclusions with consideration for sustainable development. (WK1 to WK4)
PO3	Design/Development of Solutions: Design creative solutions for complex engineering problems and design/develop systems/components/processes to meet identified needs with consideration for the public health and safety, whole-life cost, net zero carbon, culture, society and environment as required. (WK5)
PO4	Conduct Investigations of Complex Problems: Conduct investigations of complex engineering problems using research-based knowledge including design of experiments, modelling, analysis & interpretation of data to provide valid conclusions. (WK8).
PO5	Engineering Tool Usage: Create, select and apply appropriate techniques, resources and modern engineering & IT tools, including prediction and modelling recognizing their limitations to solve complex engineering problems. (WK2 and WK6)
PO6	The Engineer and The World: Analyze and evaluate societal and environmental aspects while solving complex engineering problems for its impact on sustainability with reference to economy, health, safety, legal framework, culture and environment. (WK1, WK5, and WK7).
PO7	Ethics: Apply ethical principles and commit to professional ethics, human values, diversity and inclusion; adhere to national & international laws. (WK9)
PO8	Individual and Collaborative Team work: Function effectively as an individual, and as a member or leader in diverse/multi-disciplinary teams.
PO9	Communication: Communicate effectively and inclusively within the engineering community and society at large, such as being able to comprehend and write effective reports and design documentation, make effective presentations considering cultural, language, and learning differences.
PO10	Project Management and Finance: Apply knowledge and understanding of engineering management principles and economic decision-making and apply these to one's own work, as a member and leader in a team, and to manage projects and in multidisciplinary environments.
PO11	Life-Long Learning: Recognize the need for, and have the preparation and ability for i) independent and life-long learning ii) adaptability to new and emerging technologies and iii) critical thinking in the broadest context of technological change. (WK8)

Abstract

In a world increasingly affected by natural and man-made disasters, timely awareness and preparedness are critical for survival. Traditional disaster management education often fails to engage communities effectively, relying on static material rather than practical experiences. “Disaster Ready” is an innovative, robust web application designed to bridge this gap through highly interactive safety education and gamified virtual evacuation drills.

At its core, Disaster Ready empowers students, teachers, and administrators to actively participate in disaster preparedness. The platform features comprehensive learning modules covering diverse scenarios such as Earthquakes, Floods, Fires, Cyclones, Heatwaves, and Droughts. To enhance engagement, a gamification engine continuously rewards users with points, badges, and leaderboard rankings, motivating students to proactively improve their survival knowledge.

A standout feature is the platform’s Virtual Evacuation Drills. These meticulously simulated, timed virtual scenarios challenge users to make life-saving decisions under pressure, providing real-time feedback and analytics. Furthermore, cutting-edge Generative AI has been incorporated via Google’s Gemini to create “Safety Buddy”—an intelligent chatbot tailored strictly to provide users with accurate, contextualized emergency advice. Designed as a Progressive Web App (PWA) with a scalable architecture using the MERN stack (MongoDB, Express.js, React, Node.js), Disaster Ready fundamentally transforms how schools and communities build life-saving reflexes and actionable resilience.

Acknowledgement

We the students of **Xavier Institute of Engineering, Mahim** of **Third Year Engineering** in the department of **Computer Engineering** have great pleasure in presenting our efforts of developing the project named as "**Disaster Ready: Students – Centered Disaster Preparedness Web-App**".

We would like to express our heartfelt gratitude to **Dr. Sushama Khanvilkar**, **Head of the Department**, for providing us with inspiration, valuable guidance, and timely suggestions throughout our Mini Project journey.

Our immense appreciation also goes to our esteemed **Guide Dr. Sushama Khanvilkar** and **Coordinator Prof. Kavita Jain** for their unwavering support and the opportunity they provided us to undertake this challenging project has been truly invaluable. This experience not only allowed us to conduct extensive project work but also exposed us to a wealth of new knowledge for which we are genuinely thankful.

Chapter 1
Introduction

1.1 Introduction:

Disaster awareness and preparedness are no longer optional skills; they are essentials for modern survival. As communities face an increasing frequency of catastrophic events, adequate preparation can mean the difference between life and death. The “Disaster Ready” application is conceived out of this necessity, blending educational content with modern technological paradigms to create a life-saving tool.

Historically, disaster education has relied on seminars, static books, and passive videos, which lack the engagement required to formulate instinctual responses. Disaster Ready disrupts this traditional methodology using gamification, simulation, and real-time AI mentoring. Target demographics—especially younger students—benefit from interactive, competitive learning environments, allowing them to internalize safety measures effectively before genuine emergencies strike.

To achieve this comprehensive level of preparedness, the system is architected as a highly accessible Progressive Web Application (PWA) capable of operating effectively even during the low-connectivity scenarios typical of actual crises. Beyond individual student engagement, the platform incorporates a sophisticated multi-role structure—equipping educators and administrators with centralized analytics to continuously assess the collective safety readiness of their institution. Driven by a robust technology stack and real-time capabilities, the platform completely bridges the gap between theoretical knowledge and actionable survival skills. Ultimately, Disaster Ready transcends traditional educational software by transforming standard classrooms into proactively resilient communities, ensuring the next generation is fully equipped to make autonomous, life-saving decisions when time is of the essence.

1.2 Motivation:

When a natural or man-made disaster strikes, human panic frequently overrides logical decision-making. Psychological research demonstrates that simulated stress testing—achieved through regular, immersive drills—is one of the only reliable methods to build muscle memory and intuitive life-saving reflexes. However, conducting frequent physical safety drills is logistically challenging, highly disruptive to academic schedules, and resource-intensive for educational institutions. Schools face severe constraints related to budgeting, campus coordination, and unpredictable weather, which severely limits the frequency of practical evacuation training. Consequently, critical emergency preparedness is often reduced to infrequent, passive assemblies or static safety manuals that fail to engage modern, tech-savvy students effectively.

The central motivation behind "Disaster Ready" is to overcome these pervasive logistical barriers by establishing a highly accessible, digital ecosystem for crisis preparation. By transitioning high-pressure evacuations into a virtual, easily repeatable format, the application enables schools to conduct safe and frequent simulations without interrupting physical classes. This virtual approach democratizes safety training, allowing unlimited practice repetitions so that life-saving reflexes become second nature. Furthermore, the modern educational landscape struggles to capture student attention using outdated methodologies. The project aims to eliminate this severe lack of engagement by meeting students where they already are: in interactive, digital environments.

By integrating modern gamification techniques—such as competitive leaderboards, dynamic scoring, and reward badges—the system replaces student apathy with intrinsic motivation. Moving beyond static digital solutions, the inclusion of an advanced, AI-driven mentor provides a highly personalized, continuously available safety tutor that adapts to individual learning paces. Ultimately, this project is driven by a profound desire to modernize disaster training. It seeks to provide measurable accountability to educational institutions and peace of mind to communities, making critical survival preparation an engaging, intuitive, and highly scalable process that genuinely protects the next generation.

1.3 Problem Statement:

Currently, there is a serious lack of engaging and effective platforms dedicated to teaching students about disaster preparedness. Traditional learning methods—such as reading static textbooks, attending long seminars, or watching passive videos—are deeply flawed when it comes to teaching modern students. Because these methods are not interactive, students usually find them boring. Modern students grew up with interactive technology and gaming, which means they lose focus quickly when listening to standard lectures. As a result of this disconnect, students forget the life-saving rules very quickly and fail to develop the quick, instinctual reflexes needed during the panic of a real emergency.

Additionally, educational institutions face severe logistical challenges when trying to keep their campuses safe. Conducting physical fire or earthquake drills is very expensive, requires massive scheduling efforts, and disrupts normal classes. Because of this, schools only run these physical drills a few times a year. Furthermore, teachers and administrators do not have an easy, centralized way to track if their students genuinely understand disaster protocols after these minimal assemblies. Without clear analytics or digital performance tracking, schools simply cannot tell which specific students need extra help or which disaster topics were misunderstood by the class.

Beyond the classroom, when students have sudden questions about what to do in specific safety scenarios, they do not have access to an instant, reliable expert. Generic search engines can provide wrong or confusing disaster advice. Finally, many existing educational apps completely stop working without an active internet connection, making them useless during actual crisis situations where cell towers or Wi-Fi networks might suddenly fail.

The proposed system, "Disaster Ready," is created to definitively solve these exact problems. It replaces outdated education by delivering a fun, scalable, and highly interactive digital platform. By using gamified learning modules to hold student attention, timed virtual evacuation drills to build reflexes without leaving the classroom, clear tracking dashboards for teachers, and an always-available, customized AI mentor ("Safety Buddy"), the platform ensures that schools can proactively, safely, and reliably train their students for unexpected emergencies.

1.4 Objectives:

The primary objective of the "Disaster Ready" project is to solve the flaws in traditional disaster education by achieving the following specific goals:

- To design and develop a scalable, user-friendly web application using modern technologies (the MERN stack) that serves as a centralized digital hub for all disaster preparedness education.
- To implement Interactive Learning Modules that replace boring, static textbooks with engaging, easy-to-understand disaster topics (such as Earthquakes, Floods, Fires, and Cyclones).
- To build timed Virtual Evacuation Drills that safely simulate the panic and time-pressure of real emergencies, allowing students to build quick survival reflexes without needing expensive physical school drills.
- To embed a strong Gamification Engine featuring dynamic points, reward badges, and class leaderboards that naturally motivate students to keep learning and competing with their peers.
- To integrate an intelligent AI Chatbot ("Safety Buddy") using Google Gemini, providing students with a 24/7, highly reliable digital expert to instantly answer any personalized safety questions they might have.
- To create a multi-role monitoring system that gives teachers and administrators clear, easy-to-read analytical dashboards so they can track exactly which students are prepared and which ones need more help.
- To ensure critical offline accessibility by structuring the platform as a Progressive Web App (PWA), guaranteeing that life-saving safety information remains available even during emergency power or internet outages.

Chapter 2
LITERATURE SURVEY

2.1 SURVEY OF EXISTING SYSTEM

To understand the true necessity of the "Disaster Ready" platform, it is important to review the systems and tools that currently exist for disaster management education. A survey of the current technical landscape reveals that existing solutions typically fall into three major categories:

1. Passive Alert Systems (e.g., Weather and SOS Apps) Many region-specific or national disaster applications focus almost entirely on real-time warnings and post-disaster response. While these tools are critical for sending SOS messages or receiving sudden flood alerts, they completely lack an educational component. They tell users when an emergency is happening, but they do not actively train users on what to do before the disaster strikes.

2. Static Educational Repositories (e.g., NGO Reference Websites) Several safety organizations and schools provide educational portals on their websites. However, these systems usually act as simple digital filing cabinets. They offer long, text-heavy PDFs or basic video guidelines for users to read passively. Because these systems have no interactive quizzes, no virtual drills, and no gamification, it is impossible for educators to know if a student actually read the material or truly understood it.

3. High-End Hardware Simulators Some advanced technological institutes use full-scale Virtual Reality (VR) simulators to train rescue professionals (like firefighters or medical responders). While these simulators are highly interactive and feature realistic pressure, they are extremely expensive and require heavy, specialized hardware. They are entirely inaccessible to the average school, teacher, or student for regular classroom use.

Summary of Existing Systems: Overall, the existing systems are either too passive, too boring for students, or far too expensive for regular schools. There is a clear lack of a middle-ground solution: a highly accessible, browser-based platform that combines the stress-testing interactivity of a simulator with the affordability and analytical tracking needed by everyday educational institutions.

2.2 LIMITATION: EXISTING SYSTEM OR RESEARCH GAP

Despite the availability of various disaster management applications and educational portals, there are significant gaps in how safety training is currently delivered to students. The primary limitations and research gaps in existing systems include:

- Lack of Gamification and Engagement: Most safety applications completely lack motivation frameworks, such as class leaderboards and reward badges. Because they are not fun or engaging, younger students quickly lose interest and fail to retain the necessary survival rules.
- Passive Learning Methods: There is an overwhelming reliance on reading text or watching videos. Existing systems lack dynamic, pressure-tested interactive drills that force students to make life-saving choices under a simulated time limit.
- Absence of Dedicated Mentoring: When a student is confused about a specific disaster protocol, existing platforms do not offer immediate answers. There is a complete lack of a 24/7, specialized AI agent dedicated strictly to clarifying crisis management processes.
- Administrative Disconnect: Current educational tools do not provide comprehensive analytical dashboards for teachers. This creates a massive gap for schools, as institutions have no digital way to actively monitor or measure the genuine safety preparedness of an entire classroom.
- Internet Dependency: Most learning web applications require a high-speed, continuous internet connection to load resources and videos. During a real disaster scenario where networks might fail or power goes out, these applications become entirely inaccessible.

By identifying these major limitations, it becomes clear that there is a critical research gap for a safety platform that is highly engaging, analytically trackable, artificially intelligent, and accessible offline—which the "Disaster Ready" platform directly solves.

2.3 MINIPROJECT CONTRIBUTION

The "Disaster Ready" application makes several significant contributions to the field of disaster management education, directly addressing the limitations found in existing systems. The core contributions of this mini project are:

- Active Skill Retention over Passive Reading: By transitioning disaster instructions from static textbooks to highly interactive, timed virtual evacuation drills, the project contributes a method for students to build genuine survival reflexes and muscle memory.
- Accessible Modern Tech Integration: Unlike expensive VR hardware, this project contributes a highly accessible, browser-based Progressive Web Application (PWA). This ensures that any school, regardless of budget, can provide top-tier disaster simulations using standard computers or mobile devices.
- Implementation of Specialized AI: The project introduces "Safety Buddy," contributing a novel use of Google Gemini Generative AI that has been strictly prompt-engineered to act as a 24/7, highly reliable guide for emergency protocols.
- Centralized Institutional Accountability: Rather than leaving student preparedness to chance, the project contributes a multi-role analytical dashboard. This provides teachers and administrators with data-driven insights into exactly which students are prepared and which disaster modules require further teaching.

Ultimately, the contribution of this mini project is a comprehensive, scalable, and engaging digital ecosystem that transforms theoretical safety knowledge into actionable, life-saving readiness.

Chapter 3
PROPOSED SYSTEM

3.1 INTRODUCTION

The Proposed System chapter details the core technical foundation and structural logic behind the "Disaster Ready" platform. While previous chapters focused heavily on analyzing the flaws of traditional, passive educational methods, this chapter outlines exactly how our modern digital solution actively replaces them.

By moving from a static learning model to an active, tech-driven ecosystem, the proposed system introduces a fully scalable, highly engaging Progressive Web Application (PWA). The primary goal of the proposed system is to seamlessly merge interactive learning modules with high-pressure virtual evacuation drills, all monitored by a multi-role analytical dashboard.

To achieve this high level of engagement, the system completely removes the friction of outdated hardware and software limitations. It utilizes a web-first approach, meaning students and teachers do not need to download heavy, device-specific applications from an App Store. Instead, the entire system is instantly available via any standard web browser, completely democratizing access to crucial survival training. Furthermore, to combat the critical modern issue of dropping student attention spans, the proposed system intrinsically embeds psychological motivators into every action. By turning life-saving techniques into a dynamic, score-based game experience, the project ensures that students voluntarily interact with the material long enough to genuinely build cognitive survival reflexes securely in their brains.

The following sections will rigorously break down the precise MERN stack client-server architecture used to build the platform, the step-by-step algorithms governing the gamification and virtual drill logic, and the specific hardware and software requirements necessary to run the system smoothly. Ultimately, the proposed system aims to provide a centralized, artificially intelligent, and highly accessible environment to effectively train the next generation for catastrophic events.

3.2 ARCHITECTURE /FRAMEWORK

To successfully deliver a highly interactive educational experience, the "Disaster Ready" platform is built upon a modern, multi-layered MERN stack architecture and a Progressive Web Application (PWA) framework. This comprehensive data flow logically showcases how different user roles interact with the specialized frontend hubs, how requests are securely routed through the Express API controllers, and how data is dynamically managed within the MongoDB collections and external AI services.

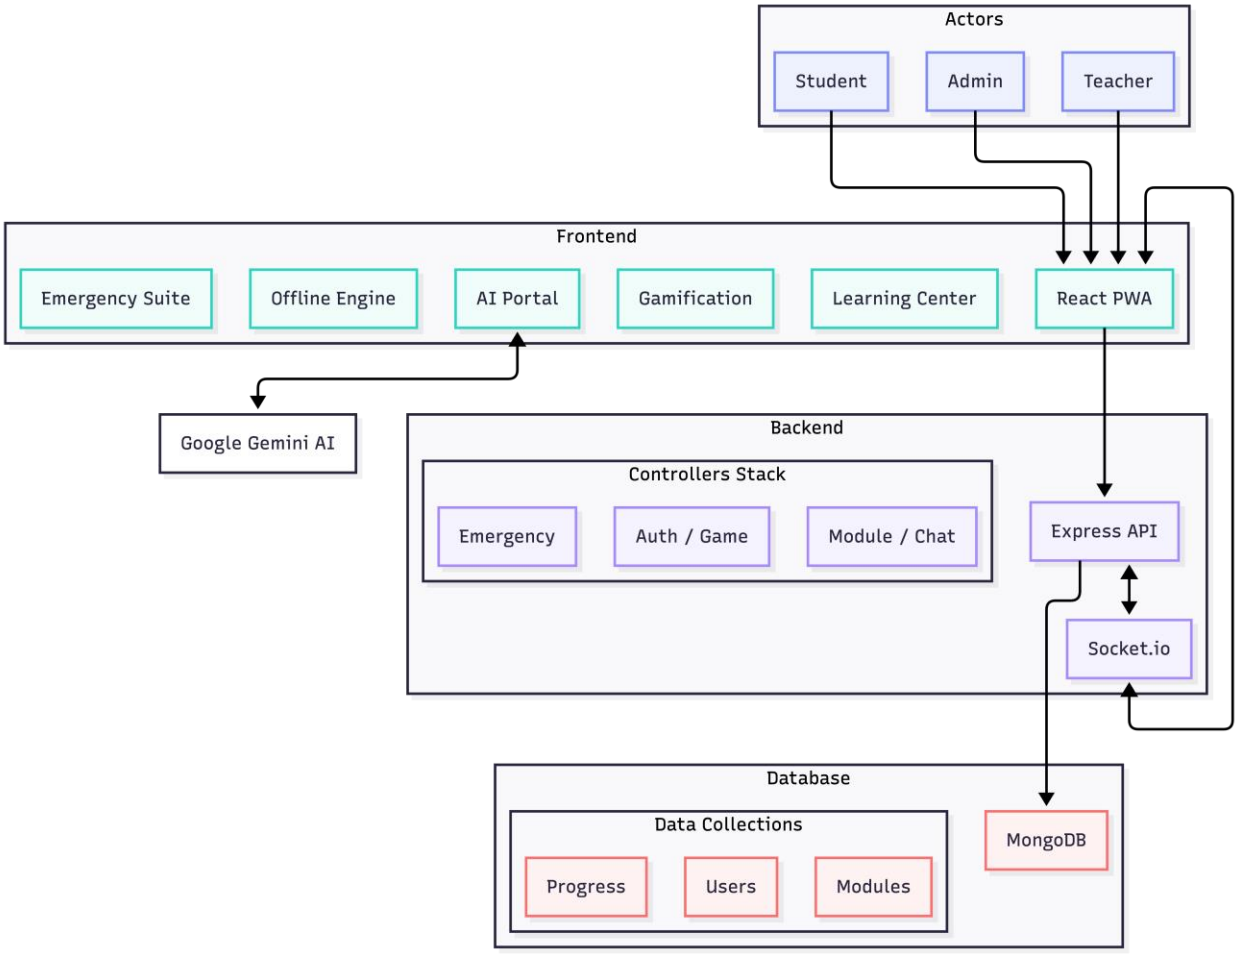

Fig 3.1 Architectural Diagram

3.3 ALGORITHM AND PROCESS DESIGN

The overall behavior of the "Disaster Ready" system is carefully organized into three primary process workflows:

1. Authentication & Role-Based Access Process

- The user inputs their login credentials on the application's secure entry portal.
- The backend database verifies the data and correctly identifies the user's specific role (Student, Teacher, or Admin).
- A secure JWT (JSON Web Token) is instantly generated and sent to the client, effectively authorizing access and unlocking the appropriate user-specific dashboard.

2. Gamification & Learning Process

- The student accesses the Learning Center and selects a specific educational disaster module.
- The backend system fetches and seamlessly displays the interactive multimedia course material on the frontend interface.
- To accurately test knowledge, the system dynamically generates a randomized quiz from the question database, ensuring the user cannot simply memorize a static test format.
- Upon successful completion of the module, the backend algorithms calculate the score, upgrade the user's total experiential points, and automatically mint milestone badges to update the global Leaderboard.

3. Virtual Evacuation Drill Algorithm

- The student initializes a virtual drill scenario, triggering a high-pressure, real-time countdown timer.
- A series of scenario-based survival choices are presented dynamically on the screen, requiring immediate decision-making.
- If the user makes an incorrect choice, the overarching algorithm issues a severe time-penalty reduction to realistically simulate the consequences of real-world panic.
- The final survival score is calculated based on the precise ratio of correct decisions versus the user's final reaction time. This performance data is then immediately saved and transmitted to the teacher’s analytical dashboard for evaluation.

4. AI Mentorship (Safety Buddy) Workflow

- The student interacts with the "Safety Buddy" portal on the frontend, inputting specific disaster or safety-related questions.
- The backend chat controller securely receives the request, wraps it in a rigorous safety prompt, and securely transmits it to the external Google Gemini AI API.

- To prevent AI hallucinations or off-topic conversations, the system strictly filters the API response to ensure it only provides verified disaster survival protocols.
- The accurate, highly contextualized emergency advice is then instantly streamed back down to the user's chat interface.

5. PWA Offline Fallback Process

- Upon first accessing the platform with an active internet connection, the frontend Service Worker silently caches all critical UI elements, icons, and text-based disaster reading materials.
- If the user suddenly loses internet access (e.g., during an emergency blackout), the Service Worker automatically intercepts all outgoing network requests.
- The system actively detects the offline status and instantly serves the necessary emergency UI and fallback pages directly from the device's local cache memory, completely preventing the application from crashing.

6. Automated Certificate Generation Process

- The system actively tracks the individual progress of a student across all major disaster modules, quizzes, and virtual drills.
- Once the backend controllers verify that the student has successfully achieved a 100% completion rate and passed all critical system assessments, an automated algorithmic trigger is initiated.
- The backend system dynamically generates a personalized, official "Disaster Readiness Certificate," instantly embedding the student's specific name, completion date, and final overall survival scores.
- The student receives a milestone notification on their frontend dashboard, where they can securely download the certificate as a high-resolution PDF, providing tangible, printable proof of their life-saving qualifications.

3.4 DETAILS OF HARDWARE & SOFTWARE

To ensure the "Disaster Ready" platform securely processes virtual evacuation drills without lag and handles live real-time connections efficiently, the system strictly requires the following specifications:

Hardware Requirements (Minimum System Specifications):

- Processor: Intel Core i3 / AMD Ryzen 3 (or Apple Silicon M-series equivalent) and above.
- Memory (RAM): 4 GB minimum (8 GB highly recommended for stable server runtime and local development).
- Storage Space: Minimum of 500 MB of free hard drive space (Solid State Drive (SSD) storage is highly preferred for faster local data retrieval).
- Network: An active broadband internet connection is required for the initial PWA download, live database fetching, and external Google Gemini API requests. (Note: Once cached, the PWA gracefully shifts to offline device storage).

Software Requirements (Development & Deployment Environment):

- Operating System: Cross-platform capabilities (Windows 10/11, macOS, or Ubuntu/Linux distributions).
- Frontend Technologies: React.js framework utilizing strict TypeScript, structured with modern Tailwind CSS, and integrated with Socket.io-client for real-time web sockets.
- Backend Environment: Node.js runtime environment (version 16.x or higher) powered by a foundational Express.js server framework.
- Database System: MongoDB Atlas (NoSQL Cloud deployment) or a local MongoDB Compass environment for offline backend testing.
- Client Accessibility Tool: Any modern, HTML5-compliant web browser (e.g., Google Chrome, Apple Safari, Microsoft Edge).

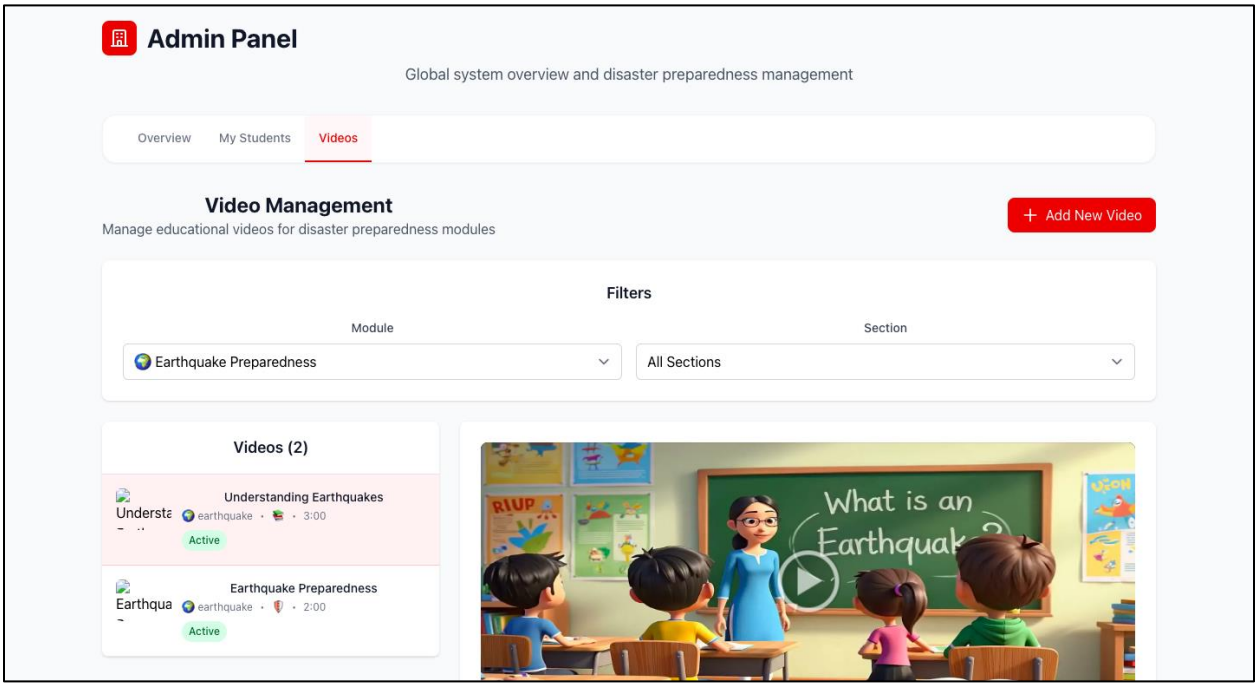

Fig 4.6: Admin Panel

Chapter 5
CONCLUSION AND FUTURE WORK

Conclusion:

The "Disaster Ready" platform successfully bridges the critical gap between passive theoretical education and actionable survival readiness. By decisively moving away from static textbooks and boring seminars, the project has proven that modern web technology can transform disaster preparedness into a highly interactive, scalable, and personalized experience. The successful integration of MERN stack gamification structures significantly enhances student engagement, while the deployment of virtual timed drills actively builds crucial, life-saving reflexes.

Furthermore, utilizing a Progressive Web App (PWA) architecture achieved the project's most vital technical objective: maintaining localized offline accessibility during emergency network outages. Coupled with the real-time hazard broadcasting of Socket.io and the specialized mentorship of the Google Gemini-powered "Safety Buddy," the platform functions as a comprehensive safety ecosystem. Ultimately, this project demonstrates that providing educational institutions with a centralized, data-driven platform empowers them to proactively build safer, resilient communities that are fully prepared for catastrophic events.

Future Work:

While the current development of the platform delivers a highly robust educational ecosystem, there are several promising engineering avenues for future enhancement:

- IoT & Live Meteorological Integration: Integrating real-time Internet of Things (IoT) sensors and external weather APIs (such as government seismology data) to automatically trigger server-side hazard alerts, completely eliminating the need for manual administrator input.
- WebXR Immersion (AR/VR): Upgrading the virtual evacuation drills using modern WebXR technologies to provide true Virtual Reality/Augmented Reality experiences, allowing students to physically navigate the safest emergency exits over a 3D overlay mapping of their own campus.
- Multi-Lingual AI Support: Expanding the "Safety Buddy" Generative AI and the core user interface to systematically process and support regional Indian languages, massively democratizing platform access for rural schools.
- Parent/Family Sync Capabilities: Developing an additional platform sub-layer to securely connect parent and guardian devices. This would enable an automated "I am Safe" broadcast protocol, instantly notifying local families the moment a student successfully completes an emergency roll-call during an active campus crisis.
